

MultiGmail Email Triage & Daily Digest Automation (n8n)

This document provides a complete overview of the two n8n automations built to manage multiple Gmail inboxes, prioritize incoming emails using AI, and deliver structured daily summaries via Slack while keeping Google Sheets clean and organized.

Automation 1: Live Email Triage & Classification

- Monitors multiple connected Gmail inboxes in real time for new incoming emails.
- Captures essential email metadata including sender, subject, body snippet, thread ID, and existing Gmail labels.
- Passes email content to an AI agent that classifies each message by category (Action Required, FYI, For Review, etc.) and assigns a priority level (High, Medium, Low).
- The AI also determines whether an email requires a follow-up task or represents a calendar meeting and extracts relevant timing information.
- Email data and AI decisions are merged and normalized inside a JavaScript Code node to create a single structured decision object.
- Emails are automatically logged into Google Sheets based on priority: High, Medium, or Low.
- Gmail labels are applied to each email so inboxes visually reflect priority and category.
- If an email is actionable, a task is created in Notion with title, summary, priority, and source metadata.
- If a meeting is detected, a Google Calendar event is created automatically using the extracted date and time.

Automation 2: Daily Email Digest (Sheets → Slack)

- Runs on a scheduled basis (e.g., once per day) using a Schedule Trigger node.
- Reads accumulated email entries from three Google Sheets: High Priority, Medium Priority, and Low Priority.
- Each sheet is configured with 'Always Output Data' enabled to ensure the workflow continues even if a sheet is empty.
- A JavaScript Code node aggregates the sheet data and builds Slack Block Kit messages for each priority level.
- Slack messages are formatted with headers, timestamps, dividers, and readable summaries for clarity.
- Three separate Slack messages are sent to dedicated channels: #highpriorities, #mediumpriorities, and #lowpriorities.
- Each Slack message is sent only if its corresponding sheet contains data, preventing empty or duplicate notifications.
- After successful Slack delivery, each Google Sheet is cleared to prepare for the next day's digest.

Key Benefits & Outcomes

- Eliminates the need to manually monitor multiple Gmail inboxes throughout the day.
- Ensures consistent prioritization and labeling of emails using AI-driven logic.
- Automatically converts important emails into Notion tasks and calendar events.

- Provides a clean, structured daily overview of all email activity via Slack.
- Prevents missed actions while reducing notification noise and inbox overload.
